# Descent methods for smooth problems

## Unconstrained smooth optimisation

We first consider minimising

$$\min_{x \in \mathbb{R}^n} F(x)$$

where  $F : \mathbb{R}^n \rightarrow \mathbb{R}$  is a proper, convex and differentiable function.

## Unconstrained smooth optimisation

We first consider minimising

$$\min_{x \in \mathbb{R}^n} F(x)$$

where  $F : \mathbb{R}^n \rightarrow \mathbb{R}$  is a proper, convex and differentiable function.

- Assume that the set of minimisers is nonempty,

$$\operatorname{argmin}(F) = \left\{ x \in \mathbb{R}^n ; F(x) = \min_{x \in \mathbb{R}^n} F(x) \right\} \neq \emptyset$$

- $x_* \in \operatorname{argmin}(F)$  has no closed form expression in general.
- We will consider iterative algorithms which start at a point  $x_0$  and build a sequence  $x_k$  which converge to a minimiser.

# Descent methods for smooth problems

## General iterative method

Initialization  $x_0 \in \text{dom}(F)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a search direction  $d_k$

    Update  $x_{k+1} = x_k - \gamma_k d_k$

**end**

# Choice of $d_k$ to enforce descent

## Descent methods

An algorithm is called a descent method if  $F(x_{k+1}) < F(x_k)$ .

- $\varphi_k(\gamma) \stackrel{\text{def.}}{=} F(x_k + \gamma d_k)$  is a decreasing function
- So, for  $d_k$  to be a descent direction, we need  $\varphi'_k(0) = \langle \nabla F(x_k), d_k \rangle < 0$ .

## Step-size (Choice of $\gamma_k$ )

1. Fixed step size  $\gamma_k \equiv \gamma$ .

## Step-size (Choice of $\gamma_k$ )

1. Fixed step size  $\gamma_k \equiv \gamma$ .
2. Line search along the direction  $d_k$ , i.e. minimise

$$\gamma_k = \operatorname{argmin}_{\gamma} \varphi_k(\gamma) \stackrel{\text{def.}}{=} F(x_k + \gamma d_k)$$

## Step-size (Choice of $\gamma_k$ )

1. Fixed step size  $\gamma_k \equiv \gamma$ .
2. Line search along the direction  $d_k$ , i.e. minimise

$$\gamma_k = \operatorname{argmin}_{\gamma} \varphi_k(\gamma) \stackrel{\text{def.}}{=} F(x_k + \gamma d_k)$$

3. Backtracking: Given direction  $d_k$ , choose  $\delta \in (0, 1)$  and  $\beta \in (0, 1)$  and let  $\gamma = 1$ .

while  $F(x_k + \gamma d_k) > F(x_k) + \delta \gamma \langle \nabla F(x_k), d_k \rangle$  :  $\gamma = \beta \gamma$ .

For some tolerance level  $\varepsilon > 0$ , we could consider:

For some tolerance level  $\varepsilon > 0$ , we could consider:

- Function value:  $F(x_{k+1}) - F(x_k) \leq \varepsilon$ .

For some tolerance level  $\varepsilon > 0$ , we could consider:

- Function value:  $F(x_{k+1}) - F(x_k) \leq \varepsilon$ .
- Sequence residue:  $\|x_k - x_{k+1}\| \leq \varepsilon$ .

For some tolerance level  $\varepsilon > 0$ , we could consider:

- Function value:  $F(x_{k+1}) - F(x_k) \leq \varepsilon$ .
- Sequence residue:  $\|x_k - x_{k+1}\| \leq \varepsilon$ .
- Optimality condition:  $\|\nabla F(x_k)\| \leq \varepsilon$ .

Descent methods

**Gradient descent**

Subgradient descent

Projected gradient descent

Douglas-Rachford splitting

Alternating Direction Method of Multipliers (ADMM)

Primal-Dual splitting

The method of steepest descent or gradient descent chooses  $d_k = -\nabla F(x_k)$ . If  $x_k$  is not a stationary point, then  $\nabla F(x_k) \neq 0$  and

$$\langle \nabla F(x_k), d_k \rangle = -\|\nabla F(x_k)\|^2 < 0$$

### Gradient descent

Initialization  $x_0 \in \text{dom}(F)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$

    Update  $x_{k+1} = x_k - \gamma_k \nabla F(x_k)$

**end**

NB: method may not converge if  $\gamma_k$  is too large.

## Convergence of gradient descent

Let  $F \in \mathcal{C}^1$ ,  $\nabla F$  is  $L$ -Lipschitz and  $\operatorname{argmin}(F) \neq \emptyset$ . Let  $\gamma_k \equiv \gamma$ .

### General case

Choosing fixed  $\gamma \in (0, 2/L)$ ,  $\nabla F(x_k) \rightarrow 0$ .

## Convergence of gradient descent

Let  $F \in \mathcal{C}^1$ ,  $\nabla F$  is  $L$ -Lipschitz and  $\operatorname{argmin}(F) \neq \emptyset$ . Let  $\gamma_k \equiv \gamma$ .

### General case

Choosing fixed  $\gamma \in (0, 2/L)$ ,  $\nabla F(x_k) \rightarrow 0$ .

### Convex case

Suppose that  $F$  is **convex** and let  $x_*$  be a minimiser. For  $\gamma \in (0, 2/L)$ ,

$$F(x_k) - F(x_*) \leq \frac{\|x_0 - x_*\|^2}{\theta(k+1)}, \quad \text{where } \theta = \gamma(1 - \gamma L/2). \quad (2.1)$$

# Convergence of gradient descent

Let  $F \in \mathcal{C}^1$ ,  $\nabla F$  is  $L$ -Lipschitz and  $\operatorname{argmin}(F) \neq \emptyset$ . Let  $\gamma_k \equiv \gamma$ .

## General case

Choosing fixed  $\gamma \in (0, 2/L)$ ,  $\nabla F(x_k) \rightarrow 0$ .

## Convex case

Suppose that  $F$  is **convex** and let  $x_*$  be a minimiser. For  $\gamma \in (0, 2/L)$ ,

$$F(x_k) - F(x_*) \leq \frac{\|x_0 - x_*\|^2}{\theta(k+1)}, \quad \text{where } \theta = \gamma(1 - \gamma L/2). \quad (2.1)$$

## Strongly-convex case

If  $F$  is  **$\alpha$ -strongly convex**, that is,  $F(x) - \alpha \|x\|^2/2$  is convex (if  $F \in \mathcal{C}^2$ , equivalent to  $\nabla^2 F(x) \geq \alpha \operatorname{Id}$ ), then

$$\|x_{k+1} - x_*\| \leq \max(1 - \gamma\alpha, \gamma L - 1) \|x_k - x_*\|.$$

Best constant is  $\gamma = 2/(L + \alpha)$ :

$$\|x_k - x_*\| \leq q^k \|x_0 - x_*\| \quad \text{where } q = (L - \alpha)/(L + \alpha) \in (0, 1).$$

Suppose that  $x_k$  is an element of

$$x_0 + \text{Span}\{\nabla F(x_0), \nabla F(x_1), \dots, \nabla F(x_{k-1})\}. \quad (2.2)$$

Suppose that  $x_k$  is an element of

$$x_0 + \text{Span}\{\nabla F(x_0), \nabla F(x_1), \dots, \nabla F(x_{k-1})\}. \quad (2.2)$$

### Theorem 2.1 (Nesterov's lower complexity bound)

*For any  $n \geq 2$  and  $x_0 \in \mathbb{R}^n$ ,  $L > 0$  and  $k < n$ , there exists a convex one-time continuously differentiable function  $F$  with  $L$ -Lipschitz continuous gradient, such that for any algorithm satisfying (2.2), we have*

$$F(x_k) - F(x_*) \geq \frac{L \|x_0 - x_*\|^2}{8(k+1)^2}$$

*where  $x_*$  denotes a minimiser of  $F$ .*

- This result is valid only when the number of iterations is smaller than the problem size.

Suppose that  $x_k$  is an element of

$$x_0 + \text{Span}\{\nabla F(x_0), \nabla F(x_1), \dots, \nabla F(x_{k-1})\}. \quad (2.2)$$

### Theorem 2.1 (Lower complexity bound for strongly convex functions)

*For any  $x_0 \in \ell_2(\mathbb{N})$  and  $\gamma, L > 0$ , there exists a  $\gamma$ -strongly convex one times continuously differentiable function  $f$  with  $L$ -Lipschitz gradient such that for any algorithm satisfying (2.2), we have for all  $k$*

$$f(x_k) - f(x_*) \geq \frac{\gamma}{2} \left( \frac{\sqrt{Q} - 1}{\sqrt{Q} + 1} \right)^{2k} \|x_0 - x_*\|^2.$$

*where  $Q = L/\gamma \geq 1$  is the condition number and  $x_*$  is a minimiser of  $f$ .*

# Accelerated gradient descent

## Accelerated gradient descent

Initialization  $x_0 = \bar{x}_0 \in \text{dom}(F)$  and  $\lambda_0 = 0$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$

    Update  $x_{k+1} = \bar{x}_k - \gamma_k \nabla F(\bar{x}_k)$

$$\lambda_k = \frac{1 + \sqrt{1 + 4\lambda_{k-1}^2}}{2} \text{ and } a_k = \frac{1 - \lambda_k}{\lambda_{k+1}}$$

$$\bar{x}_{k+1} = x_{k+1} + a_k(x_{k+1} - x_k)$$

**end**

If  $F$  is  $L$ -Lipschitz gradient, then by choosing  $\gamma_k = 1/L$ , AGD achieves  $\mathcal{O}(1/k^2)$  convergence rate

Descent methods

Gradient descent

**Subgradient descent**

Projected gradient descent

Douglas-Rachford splitting

Alternating Direction Method of Multipliers (ADMM)

Primal-Dual splitting

Let  $R : \mathbb{R}^n \rightarrow (-\infty, +\infty]$  be proper, convex and lower semi-continuous, but non-differentiable. Assume that  $\operatorname{argmin}(R) \neq \emptyset$  and consider

$$\min_{x \in \mathbb{R}^n} R(x). \tag{3.1}$$

## Nonsmooth optimisation

Let  $R : \mathbb{R}^n \rightarrow (-\infty, +\infty]$  be proper, convex and lower semi-continuous, but non-differentiable. Assume that  $\operatorname{argmin}(R) \neq \emptyset$  and consider

$$\min_{x \in \mathbb{R}^n} R(x). \quad (3.1)$$

Recall: the subdifferential of  $R$  at  $x$  is the set

$$\partial R(x) = \{p \in \mathbb{R}^n ; R(y) - R(x) \geq \langle p, y - x \rangle, \quad \forall y \in \mathbb{R}^n\}.$$

$$\partial \|x\|_1 = \begin{cases} 1 & x > 0 \\ -1 & x < 0 \\ [-1, 1] & x = 0 \end{cases}.$$

Note that  $\partial R(x) = \{\nabla R(x)\}$  when  $R$  is differentiable at  $x$ .

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

In general, if  $x_*$  is a solution

$$\begin{aligned}\|x_{i+1} - x_*\|^2 &= \|x_i - x_*\|^2 + \|\gamma_i g_i\|^2 - 2\gamma_i \langle g_i, x_i - x_* \rangle \\ &\leq \|x_i - x_*\|^2 + \|\gamma_i g_i\|^2 - 2\gamma_i (R(x_i) - R(x_*))\end{aligned}$$

So, summing from  $i = 0, \dots, k$  and rearranging, we have

$$\sum_{i=0}^k \gamma_i (R(x_i) - R(x_*)) \leq \|x_0 - x_*\|^2 + \sum_{i=0}^k \gamma_i^2 \|g_i\|^2 - \|x_{k+1} - x_*\|^2$$

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

If  $R$  is  $L$ -Lipschitz,

$$2 \min_{i=0}^k (R(x_i) - R(x_*)) \leq \frac{\|x_0 - x_*\|^2 + L \sum_{i=0}^k \gamma_i^2}{2 \sum_{i=0}^k \gamma_i}$$

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

If  $R$  is  $L$ -Lipschitz,

$$2 \min_{i=0}^k (R(x_i) - R(x_*)) \leq \frac{\|x_0 - x_*\|^2 + L \sum_{i=0}^k \gamma_i^2}{2 \sum_{i=0}^k \gamma_i}$$

- No convergence if  $\gamma_k$  is fixed. Note also that this is not a descent method.

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

If  $R$  is  $L$ -Lipschitz,

$$2 \min_{i=0}^k (R(x_i) - R(x_*)) \leq \frac{\|x_0 - x_*\|^2 + L \sum_{i=0}^k \gamma_i^2}{2 \sum_{i=0}^k \gamma_i}$$

- No convergence if  $\gamma_k$  is fixed. Note also that this is not a descent method.
- In general choose  $\sum_i \gamma_i^2 < \infty$  and  $\sum_i \gamma_i = +\infty$ , so  $\gamma_i$  converges to 0.

# Subgradient descent

## Subgradient descent

Initialization  $x_0 \in \text{dom}(R)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k > 0$  and a subgradient  $g_k \in \partial R(x_k)$

    Update  $x_{k+1} = x_k - \gamma_k g_k$

**end**

If  $R$  is  $L$ -Lipschitz,

$$2 \min_{i=0}^k (R(x_i) - R(x_*)) \leq \frac{\|x_0 - x_*\|^2 + L \sum_{i=0}^k \gamma_i^2}{2 \sum_{i=0}^k \gamma_i}$$

- No convergence if  $\gamma_k$  is fixed. Note also that this is not a descent method.
- In general choose  $\sum_i \gamma_i^2 < \infty$  and  $\sum_i \gamma_i = +\infty$ , so  $\gamma_i$  converges to 0.
- Choosing  $\gamma_i \equiv C/\sqrt{k+1}$  for  $k$  iterations, then

$$\min_{i=0}^k (R(x_i) - R(x_*)) \leq \frac{\|x_0 - x_*\|^2 + LC^2}{2C\sqrt{k+1}}.$$

Descent methods

Gradient descent

Douglas-Rachford splitting

Alternating Direction Method of Multipliers (ADMM)

Primal-Dual splitting

# Projection onto sets

Indicator function: Let  $\Omega \subseteq \mathbb{R}^n$

$$\iota_{\Omega}(x) = \begin{cases} +\infty & x \notin \Omega \\ 0 & x \in \Omega. \end{cases}$$

Projection onto  $\Omega$ :

$$\mathcal{P}_{\Omega}(y) \stackrel{\text{def.}}{=} \operatorname{argmin}_{x \in \Omega} \|x - y\|.$$

## Constrained smooth optimisation

Let  $F \in \mathcal{C}^1$  with  $L$ -Lipschitz gradient and let  $\Omega \subset \mathbb{R}^n$  be a closed convex set, and consider

$$\min_{x \in \Omega} F(x). \quad (4.1)$$

## Constrained smooth optimisation

Let  $F \in \mathcal{C}^1$  with  $L$ -Lipschitz gradient and let  $\Omega \subset \mathbb{R}^n$  be a closed convex set, and consider

$$\min_{x \in \Omega} F(x). \quad (4.1)$$

## Projected gradient descent method

Initialization  $x_0 \in \Omega$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k \in (0, 2/L)$

    Update  $x_{k+1/2} = x_k - \gamma_k \nabla F(x_k)$

    Project  $x_{k+1} = \mathcal{P}_\Omega(x_{k+1/2})$

**end**

- Hyperplane:  $\Omega = \{x : a^T x = b\}$ ,  $a \neq 0$

$$\mathcal{P}_\Omega = x + \frac{b - a^T x}{\|a\|^2} a.$$

- Affine subspace:  $\Omega = \{x : Ax = b\}$  with  $A \in \mathbb{R}^{m \times n}$ ,  $\text{rank}(A) = m < n$

$$\mathcal{P}_\Omega = x + A^T(AA^T)^{-1}(b - Ax).$$

- Half space:  $\Omega = \{x : a^T x \leq b\}$ ,  $a \neq 0$

$$\mathcal{P}_\Omega = x + \frac{b - a^T x}{\|a\|^2} a \quad \text{if } a^T x > b \quad \text{and} \quad x \quad \text{if } a^T x \leq b.$$

- Nonnegative orthant:  $\Omega = \mathbb{R}_+^n$

$$\mathcal{P}_\Omega = (\max\{0, x_i\})_i.$$

## Composite optimisation

$$\min_{x \in \mathbb{R}^n} \Phi(x) \stackrel{\text{def.}}{=} F(x) + R(x). \quad (4.2)$$

where  $F \in \mathcal{C}^1$  has  $L$ -Lipschitz gradient and  $R$  is proper, convex, lower semi-continuous but nonsmooth.

Note that the constrained smooth problem can be rewritten as

$$\min_{x \in \mathbb{R}^n} F(x) + \iota_{\Omega}(x).$$

### Proximal mapping

Let  $R$  be proper, convex, lower semicontinuous and bounded from below. Its proximal mapping is defined by

$$\text{prox}_{\gamma R}(y) \stackrel{\text{def.}}{=} \operatorname{argmin}_{x \in \mathbb{R}^n} \gamma R(x) + \frac{1}{2} \|x - y\|^2.$$

Note that this is precisely the projection operator  $\mathcal{P}_\Omega$  when  $R = \iota_\Omega$ .

## Proximal mapping

Let  $R$  be proper, convex, lower semicontinuous and bounded from below. Its proximal mapping is defined by

$$\text{prox}_{\gamma R}(y) \stackrel{\text{def.}}{=} \operatorname{argmin}_{x \in \mathbb{R}^n} \gamma R(x) + \frac{1}{2} \|x - y\|^2.$$

Note that this is precisely the projection operator  $\mathcal{P}_\Omega$  when  $R = \iota_\Omega$ .

**Optimality condition** denote  $y_+ \stackrel{\text{def.}}{=} \text{prox}_{\gamma R}(y)$ ,

$$\begin{aligned} 0 \in \gamma \partial R(y_+) + y_+ - y &\iff y \in (\text{Id} + \gamma \partial R)(y_+) \\ &\iff y_+ = (\text{Id} + \gamma \partial R)^{-1}(y). \end{aligned}$$

## Proximal gradient descent

Initialization  $x_0 \in \text{dom}(\Phi)$

**while** *stopping criterion not satisfied* **do**

    choose step-size  $\gamma_k \in (0, 2/L)$

    Update  $x_{k+1/2} = x_k - \gamma_k \nabla F(x_k)$

    Project  $x_{k+1} = \text{prox}_{\gamma_k R}(x_{k+1/2})$

**end**

## Example

Soft-threshold:  $R(x) = |x|$ ,

$$\text{prox}_{\gamma R}(y) = \mathcal{T}_{\gamma}(y) = \begin{cases} y - \gamma : y > \gamma, \\ 0 : y \in [-\gamma, \gamma], \\ y + \gamma : y < -\gamma. \end{cases}$$

Consider the Lasso problem where for  $y \in \mathbb{R}^m$  and a matrix  $K \in \mathbb{R}^{n \times m}$ ,

$$R(x) = \lambda \|x\|_1 \quad \text{and} \quad F(x) = \frac{1}{2} \|Kx - y\|^2$$

- $\nabla F(x) = K^*(Kx - y)$
- $L = \|K^*K\|$
- The proximal mapping of  $\gamma R$  is the soft-thresholding operator  $\mathcal{T}_\gamma$

The iterates are therefore, for  $\gamma_k \in (0, 1/\|K^*K\|]$ :

$$x_{k+1} = \mathcal{T}_{\lambda\gamma_k}(x_k - \gamma_k(K^*(Kx_k - y)))$$

Specialised to the  $\ell_1$  case, this is sometimes known as the iterative soft thresholding algorithm (ISTA).

This is also known as Forward-Backward splitting:

$$x_{k+1} = \text{prox}_{\gamma R}(x_k - \gamma \nabla F(x_k))$$

- forward: gradient descent set in  $F$
- backward: implicit step in  $R$

This is also known as Forward-Backward splitting:

$$x_{k+1} = \text{prox}_{\gamma R}(x_k - \gamma \nabla F(x_k))$$

- forward: gradient descent set in  $F$
- backward: implicit step in  $R$

By definition of prox,

$$\begin{aligned}x_{k+1} &= \operatorname{argmin}_x \left\{ \frac{1}{2} \|x - (x_k - \gamma \nabla F(x_k))\|^2 + \gamma R(x) \right\} \\&= \operatorname{argmin}_x \left\{ \frac{1}{2} \|x - x_k\|^2 + \gamma \langle x - x_k, \nabla F(x_k) \rangle + \gamma R(x) \right\} \\&= \operatorname{argmin}_x \left\{ \color{red}{F(x_k)} + \langle x - x_k, \nabla F(x_k) \rangle + \frac{1}{2\gamma} \|x - x_k\|^2 + R(x) \right\}\end{aligned}$$

So,  $x_{k+1}$  minimises  $R(x)$  plus majorisation of  $F(x)$  at  $x_k$  if  $\gamma \leq \frac{1}{L}$

# Convergence properties

FB is a descent method.

- For  $\gamma_k \equiv \gamma \in (0, 1/L]$ ,  $x_k$  converges to a minimiser and

$$\Phi(x_k) - \Phi(x_*) \leq \frac{1}{2\gamma k} \|x_0 - x_*\|^2.$$

- If  $F$  and  $R$  are strongly convex with parameters  $\mu_F$ ,  $\mu_R$  and  $\mu \stackrel{\text{def.}}{=} \mu_F + \mu_R > 0$ , then

$$\Phi(x_k) - \Phi(x_*) \leq \omega^k \frac{(1 + \gamma\mu_R)}{2\gamma} \|x_0 - x_*\|^2,$$

where  $\omega = (1 - \gamma\mu_F)/(1 + \gamma\mu_R)$ .

The convergence rate matches that of gradient descent, although faster convergence rates can be obtained by

- incorporating Nesterov acceleration. This is called FISTA (fast iterative soft thresholding).
- Another (very effective) acceleration technique for FB is the restarted-FISTA scheme.

## Other examples of proximal operators

Quadratic function  $R(x) = \frac{1}{2}x^T A x + b^T x + c$ ,  $A \succeq 0$

$$\text{prox}_{\gamma R}(y) = (\text{Id} + \gamma A)^{-1}(y - \gamma b).$$

Euclidean norm  $R(x) = \|x\|$

$$\text{prox}_{\gamma R}(y) = \begin{cases} (1 - \frac{\gamma}{\|y\|})y : \|y\| > \gamma, \\ 0 : \text{o.w.} \end{cases}$$

Nuclear norm  $R(x) = \sum_i \sigma_i$

$$\text{prox}_{\gamma R}(y) = U \mathcal{T}_{\gamma}(\Sigma) V^T.$$

## Calculus rules for proximal operators

**Quadratic perturbation**  $H(x) = R(x) + \frac{\alpha}{2} \|x\|^2 + \langle x, u \rangle + \beta, \alpha \geq 0$

$$\text{prox}_H = \text{prox}_{R/(\alpha+1)} \left( \frac{x - u}{\alpha + 1} \right).$$

**Translation**  $H(x) = R(x - z)$

$$\text{prox}_H = z + \text{prox}_R(x - z).$$

**Scaling**  $H(x) = R(x/\rho)$

$$\text{prox}_H = \rho \text{prox}_{R/\rho^2} \left( \frac{x}{\rho} \right).$$

**Reflection**  $H(x) = R(-x)$

$$\text{prox}_H = -\text{prox}_R(-x).$$

**Composition**  $H = R \circ L$  with  $L$  being bijective bounded linear mapping such that  $L^{-1} = L^*$ ,

$$\text{prox}_H = L^* \circ \text{prox}_R \circ L.$$

## Example of basis pursuit

Consider

$$\min_x \|x\|_1 \text{ subject to } Ax = b.$$

Let  $F(x) = \|x\|_1$  and  $G(x) = \iota_{\{x: Ax=b\}}$ .

(i)  $\text{prox}_{\gamma F}$  is the soft thresholding operator.

$$\begin{aligned} \text{(ii) } \text{prox}_{\gamma G}(x) &= \operatorname{argmin}_z \left\{ \|z - x\|_2^2 ; Az = b \right\} \\ &= x + \operatorname{argmin}_y \left\{ \|y\|_2^2 ; A(y + x) = b \right\} \\ &= x + A^\dagger(b - Ax). \end{aligned}$$

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

So, for any  $\gamma > 0$ , there exists  $y_*$  such that

$$y_* \in \gamma \partial F(x_*) \quad \text{and} \quad -y_* \in \gamma \partial G(x_*).$$

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

So, for any  $\gamma > 0$ , there exists  $y_*$  such that

$$y_* \in \gamma \partial F(x_*) \quad \text{and} \quad -y_* \in \gamma \partial G(x_*).$$

Letting  $z_* = y_* + x_*$ , we can write for any  $\gamma > 0$ ,

$$z_* - x_* \in \gamma \partial F(x_*) \quad \text{and} \quad x_* - z_* \in \gamma \partial G(x_*)$$

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

So, for any  $\gamma > 0$ , there exists  $y_*$  such that

$$y_* \in \gamma \partial F(x_*) \quad \text{and} \quad -y_* \in \gamma \partial G(x_*).$$

Letting  $z_* = y_* + x_*$ , we can write for any  $\gamma > 0$ ,

$$\begin{aligned} z_* - x_* &\in \gamma \partial F(x_*) \quad \text{and} \quad x_* - z_* \in \gamma \partial G(x_*) \\ \iff z_* &\in x_* + \gamma \partial F(x_*) \quad \text{and} \quad 2x_* - z_* \in x_* + \gamma \partial G(x_*) \end{aligned}$$

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

So, for any  $\gamma > 0$ , there exists  $y_*$  such that

$$y_* \in \gamma \partial F(x_*) \quad \text{and} \quad -y_* \in \gamma \partial G(x_*).$$

Letting  $z_* = y_* + x_*$ , we can write for any  $\gamma > 0$ ,

$$\begin{aligned} z_* - x_* &\in \gamma \partial F(x_*) \quad \text{and} \quad x_* - z_* \in \gamma \partial G(x_*) \\ \iff z_* &\in x_* + \gamma \partial F(x_*) \quad \text{and} \quad 2x_* - z_* \in x_* + \gamma \partial G(x_*) \\ \iff x_* &= \text{prox}_{\gamma F}(z_*) \quad \text{and} \quad 0 = \text{prox}_{\gamma G}(2x_* - z_*) - x_* \end{aligned}$$

## Intuition for the Douglas-Rachford iterates

Let  $x_*$  be a solution, then  $0 \in \partial F(x_*) + \partial G(x_*)$ .

So, for any  $\gamma > 0$ , there exists  $y_*$  such that

$$y_* \in \gamma \partial F(x_*) \quad \text{and} \quad -y_* \in \gamma \partial G(x_*).$$

Letting  $z_* = y_* + x_*$ , we can write for any  $\gamma > 0$ ,

$$z_* - x_* \in \gamma \partial F(x_*) \quad \text{and} \quad x_* - z_* \in \gamma \partial G(x_*)$$

$$\iff z_* \in x_* + \gamma \partial F(x_*) \quad \text{and} \quad 2x_* - z_* \in x_* + \gamma \partial G(x_*)$$

$$\iff x_* = \text{prox}_{\gamma F}(z_*) \quad \text{and} \quad 0 = \text{prox}_{\gamma G}(2x_* - z_*) - x_*$$

$$\iff x_* = \text{prox}_{\gamma F}(z_*) \quad \text{and} \quad z_* = z_* + \mu (\text{prox}_{\gamma G}(2x_* - z_*) - x_*).$$

The fixed point formulation

$$x_* = \text{prox}_{\gamma F}(z_*) \quad \text{and} \quad z_* = z_* + \mu (\text{prox}_{\gamma G}(2x_* - z_*) - x_*)$$

leads to the fixed point iterations

$$\begin{aligned} x_k &= \text{prox}_{\gamma F}(z_k) \\ z_{k+1} &= z_k + \mu (\text{prox}_{\gamma G}(2x_k - z_k) - x_k) \end{aligned}$$

## Intuition for the Douglas-Rachford iterates

The fixed point formulation

$$x_* = \text{prox}_{\gamma F}(z_*) \quad \text{and} \quad z_* = z_* + \mu (\text{prox}_{\gamma G}(2x_* - z_*) - x_*)$$

leads to the fixed point iterations

$$\begin{aligned} x_k &= \text{prox}_{\gamma F}(z_k) \\ z_{k+1} &= z_k + \mu (\text{prox}_{\gamma G}(2x_k - z_k) - x_k) \end{aligned}$$

Substituting the first line into the second line gives:

$$\begin{aligned} z_{k+1} &= z_k + \mu (\text{prox}_{\gamma G}(\text{rprox}_{\gamma F}(z_k)) - \text{prox}_{\gamma F}(z_k)) \\ &= (1 - \frac{\mu}{2})z_k + \frac{\mu}{2} \text{rprox}_{\gamma G}(\text{rprox}_{\gamma F}(z_k)) \end{aligned}$$

Douglas-Rachford splitting

**Alternating Direction Method of Multipliers (ADMM)**

Primal-Dual splitting

## Alternating Direction Method of Multipliers (ADMM)

We now consider the following constrained optimisation problem:

$$\min_{x,y} F(x) + G(y) \quad \text{such that} \quad Ax + By = \zeta, \quad (6.1)$$

where  $F, G \in \Gamma_0(\mathbb{R}^n)$ .

The **augmented Lagrangian** formulation is

$$\min_{x,y} \sup_{\psi} F(x) + G(y) - \langle \psi, Ax + By - \zeta \rangle + \frac{\gamma}{2} \|Ax + By - \zeta\|^2 \quad (6.2)$$

Note that the two formulations are equivalent since the supremum is  $+\infty$  if  $Ax + By \neq \zeta$ .

The ADMM iterations: alternate between descents on  $x$ ,  $y$  and ascent on  $\psi$

$$\min_{x,y} \sup_{\psi} F(x) + G(y) - \langle \psi, Ax + By - \zeta \rangle + \frac{\gamma}{2} \|Ax + By - z\|^2 \quad (6.3)$$

### ADMM

Initialization  $y_0, \psi_0, \gamma > 0$

**while** *stopping criterion not satisfied* **do**

$$x_{k+1} \in \operatorname{argmin}_x F(x) + G(y_k) - \langle \psi_k, Ax + By_k - \zeta \rangle + \frac{\gamma}{2} \|Ax + By_k - \zeta\|^2$$

$$y_{k+1} \in \operatorname{argmin}_y F(x_{k+1}) + G(y) - \langle \psi_k, Ax_{k+1} + By - \zeta \rangle + \frac{\gamma}{2} \|Ax_{k+1} + By - \zeta\|^2$$

$$\psi_{k+1} = \psi_k + \gamma(\zeta - Ax_{k+1} - By_{k+1})$$

**end**

The ADMM iterations: alternate between descents on  $x$ ,  $y$  and ascent on  $\psi$

$$\min_{x,y} \sup_{\psi} F(x) + G(y) - \langle \psi, Ax + By - \zeta \rangle + \frac{\gamma}{2} \|Ax + By - z\|^2 \quad (6.3)$$

## ADMM

Initialization  $y_0, \psi_0, \gamma > 0$

**while** *stopping criterion not satisfied* **do**

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, Ax \rangle + \frac{\gamma}{2} \|Ax + By_k - \zeta\|^2$$

$$y_{k+1} \in \operatorname{argmin}_y G(y) - \langle \psi_k, By \rangle + \frac{\gamma}{2} \|Ax_{k+1} + By - \zeta\|^2$$

$$\psi_{k+1} = \psi_k + \gamma(\zeta - Ax_{k+1} - By_{k+1})$$

**end**

Consider the Lasso example again:

$$\min_{x,y} \lambda \|y\|_1 + \frac{1}{2} \|Kx - b\|^2 \text{ such that } x - y = 0.$$

Let

- $F(x) = \frac{1}{2} \|Kx - b\|^2$ ,  $G(y) = \lambda \|y\|_1$
- $A = \text{Id}$ ,  $B = -\text{Id}$  and  $\zeta = 0$ .

The ADMM iterates are:

$$x_{k+1} = (\gamma \text{Id} + K^* K)^{-1} (K^* b + \gamma y_k + \psi_k)$$

$$y_{k+1} = \mathcal{T}_{\lambda/\gamma}(x_{k+1} - \psi_k/\gamma)$$

$$\psi_{k+1} = \psi_k + \gamma(y_{k+1} - x_{k+1}).$$

Recall that ADMM solves the problem:

$$\min_{x,y} F(x) + G(y) \text{ s.t. } Ax + By = \zeta.$$

Recall that ADMM solves the problem:

$$\min_{x,y} F(x) + G(y) \text{ s.t. } Ax + By = \zeta.$$

The dual problem is

$$\begin{aligned} & \max_p \min_{x,y} F(x) + G(y) + \langle p, \zeta - Ax - By \rangle \\ &= \max_p \min_x (-\langle A^* p, x \rangle + F(x)) + \min_y (-\langle B^* p, y \rangle + G(y)) + \langle p, \zeta \rangle \\ &= \max_p -F^*(A^* p) - G^*(B^* p) + \langle p, \zeta \rangle \end{aligned}$$

# Equivalence to Douglas-Rachford

Recall that ADMM solves the problem:

$$\min_{x,y} F(x) + G(y) \text{ s.t. } Ax + By = \zeta.$$

The dual problem is

$$\begin{aligned} & \max_p \min_{x,y} F(x) + G(y) + \langle p, \zeta - Ax - By \rangle \\ &= \max_p \min_x (-\langle A^* p, x \rangle + F(x)) + \min_y (-\langle B^* p, y \rangle + G(y)) + \langle p, \zeta \rangle \\ &= \max_p -F^*(A^* p) - G^*(B^* p) + \langle p, \zeta \rangle \end{aligned}$$

## Equivalence

ADMM is equivalent to applying DR on the dual problem

$$\min_p \tilde{F}_\zeta^*(p) + \tilde{G}^*(p)$$

where  $\tilde{G}^*(p) \stackrel{\text{def.}}{=} G^*(B^* p)$  and  $\tilde{F}_\zeta^*(p) \stackrel{\text{def.}}{=} F^*(A^* p) - \langle p, \zeta \rangle$ .

## Equivalence to Douglas-Rachford

To prove the equivalence between ADMM and DR, we will rewrite the ADMM iterates in terms of  $\xi_k \stackrel{\text{def.}}{=} Ax_k$ ,  $\eta_k \stackrel{\text{def.}}{=} By_k$  and the functions  $\tilde{G}^*$  and  $\tilde{F}_\zeta^*$ .

We will make use of the following lemma:

### Lemma 1

*Suppose that  $F^*$  is continuous at  $A^*p$  and  $G^*$  is continuous at  $B^*q$ . Define*

$$\tilde{F}(\xi) = \min_{Ax=\xi} F(x) \quad \text{and} \quad \tilde{G}(\eta) = \min_{By=\eta} G(y)$$

*Then,*

- *the minimums are achieved (thanks to Fenchel Rockafellar duality).*
- *$\tilde{G}^*(q) = G^*(B^*q)$  and  $\tilde{F}^*(p) = F^*(A^*p)$ .*

*Moreover, defining  $\tilde{F}_\zeta^*(p) = \tilde{F}^*(p) - \langle \zeta, p \rangle$ , we have*

$$\text{prox}_{\gamma \tilde{F}_\zeta^*}(x) = \text{prox}_{\gamma \tilde{F}^*}(x + \gamma \zeta).$$

**Step 1: rewrite the iterates in terms of  $\xi_k \stackrel{\text{def.}}{=} Ax_k$  and  $\eta_k \stackrel{\text{def.}}{=} By_k$**

**On  $\xi_k$**

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

## Step 1: rewrite the iterates in terms of $\xi_k \stackrel{\text{def.}}{=} Ax_k$ and $\eta_k \stackrel{\text{def.}}{=} By_k$

On  $\xi_k$

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

So,  $\xi_{k+1} = Ax_{k+1}$  satisfies

$$\xi_{k+1} \in \operatorname{argmin}_{\xi} \tilde{F}(\xi) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2$$

## Step 1: rewrite the iterates in terms of $\xi_k \stackrel{\text{def.}}{=} Ax_k$ and $\eta_k \stackrel{\text{def.}}{=} By_k$

On  $\xi_k$

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

So,  $\xi_{k+1} = Ax_{k+1}$  satisfies

$$\xi_{k+1} \in \operatorname{argmin}_{\xi} \tilde{F}(\xi) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2$$

Therefore,

$$0 \in \partial \tilde{F}(\xi_{k+1}) - \psi_k + \gamma(\xi_{k+1} + \eta_k - \zeta)$$

which implies

$$\xi_{k+1} = \operatorname{prox}_{\tilde{F}/\gamma}(\psi_k/\gamma + \zeta - \eta_k).$$

## Step 1: rewrite the iterates in terms of $\xi_k \stackrel{\text{def.}}{=} Ax_k$ and $\eta_k \stackrel{\text{def.}}{=} By_k$

On  $\xi_k$

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

So,  $\xi_{k+1} = Ax_{k+1}$  satisfies

$$\xi_{k+1} \in \operatorname{argmin}_{\xi} \tilde{F}(\xi) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2$$

Therefore,

$$0 \in \partial \tilde{F}(\xi_{k+1}) - \psi_k + \gamma(\xi_{k+1} + \eta_k - \zeta)$$

which implies

$$\xi_{k+1} = \operatorname{prox}_{\tilde{F}/\gamma}(\psi_k/\gamma + \zeta - \eta_k).$$

Similarly,

$$\eta_{k+1} = \operatorname{prox}_{\tilde{G}/\gamma}(\psi_k/\gamma + \zeta - \xi_{k+1})$$

## Step 1: rewrite the iterates in terms of $\xi_k \stackrel{\text{def.}}{=} Ax_k$ and $\eta_k \stackrel{\text{def.}}{=} By_k$

On  $\xi_k$

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

So,  $\xi_{k+1} = Ax_{k+1}$  satisfies

$$\xi_{k+1} \in \operatorname{argmin}_\xi \tilde{F}(\xi) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2$$

Therefore,

$$0 \in \partial \tilde{F}(\xi_{k+1}) - \psi_k + \gamma(\xi_{k+1} + \eta_k - \zeta)$$

which implies

$$\xi_{k+1} = \operatorname{prox}_{\tilde{F}/\gamma}(\psi_k/\gamma + \zeta - \eta_k).$$

Similarly,

$$\eta_{k+1} = \operatorname{prox}_{\tilde{G}/\gamma}(\psi_k/\gamma + \zeta - \xi_{k+1})$$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

## Step 1: rewrite the iterates in terms of $\xi_k \stackrel{\text{def.}}{=} Ax_k$ and $\eta_k \stackrel{\text{def.}}{=} By_k$

On  $\xi_k$

Recall the iteration on  $x_k$  is

$$x_{k+1} \in \operatorname{argmin}_x F(x) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2 \text{ s.t. } Ax = \xi$$

So,  $\xi_{k+1} = Ax_{k+1}$  satisfies

$$\xi_{k+1} \in \operatorname{argmin}_{\xi} \tilde{F}(\xi) - \langle \psi_k, \xi \rangle + \frac{\gamma}{2} \|\xi + \eta_k - \zeta\|^2$$

Therefore,

$$0 \in \partial \tilde{F}(\xi_{k+1}) - \psi_k + \gamma(\xi_{k+1} + \eta_k - \zeta)$$

which implies

$$\xi_{k+1} = \operatorname{prox}_{\tilde{F}/\gamma}(u_k/\gamma + \zeta).$$

Similarly,

$$\eta_{k+1} = \operatorname{prox}_{\tilde{G}/\gamma}(v_{k+1}/\gamma)$$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma \eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma} \text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma \eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma} \text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma}\text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

(i)  $\xi_{k+1} = \text{prox}_{\tilde{F}/\gamma}(u_k/\gamma + \zeta)$  with Moreau's identity implies

$$\text{prox}_{\gamma \tilde{F}^*}(u_k + \gamma\zeta) \stackrel{\text{Moreau}}{=} u_k + \gamma\zeta - \gamma\xi_{k+1} \stackrel{\text{def of } v_{k+1}}{=} v_{k+1} - \gamma\eta_k \quad (6.4)$$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma}\text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

(i)  $\xi_{k+1} = \text{prox}_{\tilde{F}/\gamma}(u_k/\gamma + \zeta)$  with Moreau's identity implies

$$\text{prox}_{\gamma \tilde{F}^*}(u_k + \gamma\zeta) \stackrel{\text{Moreau}}{=} u_k + \gamma\zeta - \gamma\xi_{k+1} \stackrel{\text{def of } v_{k+1}}{=} v_{k+1} - \gamma\eta_k \quad (6.4)$$

(ii)  $\eta_{k+1} = \text{prox}_{\tilde{G}/\gamma}(v_{k+1}/\gamma)$  implies

$$\text{prox}_{\gamma \tilde{G}^*}(v_{k+1}) \stackrel{\text{Moreau}}{=} v_{k+1} - \gamma\eta_{k+1} \stackrel{\text{3rd admm iteration}}{=} \psi_{k+1} \quad (6.5)$$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma}\text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

(i)  $\xi_{k+1} = \text{prox}_{\tilde{F}/\gamma}(u_k/\gamma + \zeta)$  with Moreau's identity implies

$$\text{prox}_{\gamma \tilde{F}^*}(u_k + \gamma\zeta) \stackrel{\text{Moreau}}{=} u_k + \gamma\zeta - \gamma\xi_{k+1} \stackrel{\text{def of } v_{k+1}}{=} v_{k+1} - \gamma\eta_k \quad (6.4)$$

(ii)  $\eta_{k+1} = \text{prox}_{\tilde{G}/\gamma}(v_{k+1}/\gamma)$  implies

$$\text{prox}_{\gamma \tilde{G}^*}(v_{k+1}) \stackrel{\text{Moreau}}{=} v_{k+1} - \gamma\eta_{k+1} \stackrel{\text{3rd admm iteration}}{=} \psi_{k+1} \quad (6.5)$$

Note also that  $\frac{1}{2}v_k = \frac{1}{2}\psi_k + \frac{1}{2}\gamma\eta_k \stackrel{\text{def.}}{=}^{u_k} \frac{1}{2}u_k + \gamma\eta_k \implies \gamma\eta_k = \frac{1}{2}v_k - \frac{1}{2}u_k$

$$(i) \quad v_{k+1} \stackrel{(6.4)}{=} \gamma\eta_k + \text{prox}_{\gamma \tilde{F}^*}(u_k) = \frac{1}{2}v_k + \frac{1}{2}\text{prox}_{\gamma \tilde{F}^*}(u_k)$$

## Step 2: rewrite in terms of $\tilde{F}^*$ and $\tilde{G}^*$

Define  $u_k \stackrel{\text{def.}}{=} \psi_k - \gamma\eta_k$  and  $v_{k+1} \stackrel{\text{def.}}{=} \psi_k + \gamma(\zeta - \xi_{k+1})$

### Moreau's identity

Let  $f$  be proper, convex and lower semicontinuous and let  $f^*$  be its convex conjugate. Then for  $\gamma > 0$ ,  $\frac{1}{\gamma}\text{prox}_{\gamma f^*}(\gamma x) + \text{prox}_{f/\gamma}(x) = x$

(i)  $\xi_{k+1} = \text{prox}_{\tilde{F}/\gamma}(u_k/\gamma + \zeta)$  with Moreau's identity implies

$$\text{prox}_{\gamma \tilde{F}^*}(u_k + \gamma\zeta) \stackrel{\text{Moreau}}{=} u_k + \gamma\zeta - \gamma\xi_{k+1} \stackrel{\text{def of } v_{k+1}}{=} v_{k+1} - \gamma\eta_k \quad (6.4)$$

(ii)  $\eta_{k+1} = \text{prox}_{\tilde{G}/\gamma}(v_{k+1}/\gamma)$  implies

$$\text{prox}_{\gamma \tilde{G}^*}(v_{k+1}) \stackrel{\text{Moreau}}{=} v_{k+1} - \gamma\eta_{k+1} \stackrel{\text{3rd admm iteration}}{=} \psi_{k+1} \quad (6.5)$$

Note also that  $\frac{1}{2}v_k = \frac{1}{2}\psi_k + \frac{1}{2}\gamma\eta_k \stackrel{\text{def.}}{=} u_k \stackrel{\text{def.}}{=} \frac{1}{2}u_k + \gamma\eta_k \implies \gamma\eta_k = \frac{1}{2}v_k - \frac{1}{2}u_k$

$$(i) \quad v_{k+1} \stackrel{(6.4)}{=} \gamma\eta_k + \text{prox}_{\gamma \tilde{F}^*}(u_k) = \frac{1}{2}v_k + \frac{1}{2}\text{prox}_{\gamma \tilde{F}^*}(u_k)$$

$$(ii) \quad 2\text{prox}_{\gamma \tilde{G}^*}(v_{k+1}) - v_{k+1} \stackrel{(6.5)}{=} v_{k+1} - 2\gamma\eta_{k+1} \stackrel{(6.5)}{=} \psi_{k+1} - \gamma\eta_{k+1} \stackrel{\text{def. of } u_{k+1}}{=} u_{k+1}.$$

The iterates are therefore

$$\begin{aligned}v_{k+1} &= \frac{1}{2}v_k + \frac{1}{2}\text{rprox}_{\gamma\tilde{F}_\zeta^*}(u_k) \\u_{k+1} &= \text{rprox}_{\gamma\tilde{G}^*}(v_{k+1})\end{aligned}$$

The iterates are therefore

$$\begin{aligned}v_{k+1} &= \frac{1}{2}v_k + \frac{1}{2}\text{rprox}_{\gamma\tilde{F}_\zeta^*}(u_k) \\u_{k+1} &= \text{rprox}_{\gamma\tilde{G}^*}(v_{k+1})\end{aligned}$$

This is precisely the Douglas-Rachford iterations

$$v_{k+1} = \frac{1}{2}v_k + \frac{1}{2}\text{rprox}_{\gamma\tilde{F}_\zeta^*}(\text{rprox}_{\gamma\tilde{G}^*}(v_k))$$

for the minimisation of

$$\begin{aligned}\Phi(p) &\stackrel{\text{def.}}{=} \tilde{F}_\zeta^*(p) + \tilde{G}^*(p) \\&= F^*(A^*p) + G^*(B^*p) - \langle \zeta, p \rangle.\end{aligned}$$

Descent methods

Gradient descent

Subgradient descent

Projected gradient descent

Douglas-Rachford splitting

Alternating Direction Method of Multipliers (ADMM)

**Primal-Dual splitting**

Consider the problem

$$\min_x F(Kx) + G(x).$$

Consider the problem

$$\min_x F(Kx) + G(x).$$

Then, by considering the Fenchel conjugate of

$$F(Kx) = \sup_y \langle Kx, y \rangle - F^*(y),$$

we have the saddle point problem

$$\min_x \sup_y \langle Kx, y \rangle - F^*(y) + G(x)$$

The primal dual splitting scheme essentially alternating between

- an implicit descent on  $x$  an implicit ascent on  $y$

The optimality conditions of  $\min_x \sup_y \langle Kx, y \rangle - F^*(y) + G(x)$  are

$$x_* - \tau K^* y_* \in x_* + \tau \partial G(x_*) \quad \text{and} \quad y_* + \sigma K x_* \in y_* + \sigma \partial F^*(y_*)$$

The optimality conditions of  $\min_x \sup_y \langle Kx, y \rangle - F^*(y) + G(x)$  are

$$x_* - \tau K^* y_* \in x_* + \tau \partial G(x_*) \quad \text{and} \quad y_* + \sigma K x_* \in y_* + \sigma \partial F^*(y_*)$$

## Primal-Dual splitting

Initialization  $x_0, y_0, \sigma, \tau > 0$

**while** *stopping criterion not satisfied* **do**

$$x_{k+1} = \text{prox}_{\tau G}(x_k - \tau K^* y_*)$$

$$y_{k+1} = \text{prox}_{\sigma F^*}(y_k + \sigma K(2x_{k+1} - x_k))$$

**end**

If  $\sigma\tau \|K\|^2 < 1$ ,  $(x_k, y_k)$  converges to a fixed point  $(x_*, y_*)$  which is a solution to the saddle point problem if a solution exists.

## The primal-dual gap

For all  $x$  and  $y$ ,

$$\begin{aligned}\min_{x'} \langle Kx', y \rangle - F^*(y) + G(x') &\leq \min_{x'} \max_{y'} \langle Kx', y' \rangle - F^*(y') + G(x') \\ &\leq \max_{y'} \langle Kx, y' \rangle - F^*(y') + G(x)\end{aligned}$$

If  $\sigma\tau \|K\|^2 < 1$ ,  $(x_k, y_k)$  converges to a fixed point  $(x_*, y_*)$  which is a solution to the saddle point problem if a solution exists.

## The primal-dual gap

For all  $x$  and  $y$ ,

$$\begin{aligned}\min_{x'} \langle Kx', y \rangle - F^*(y) + G(x') &\leq \min_{x'} \max_{y'} \langle Kx', y' \rangle - F^*(y') + G(x') \\ &\leq \max_{y'} \langle Kx, y' \rangle - F^*(y') + G(x)\end{aligned}$$

Defining the primal-dual gap as

$$\mathcal{G}(x, y) = \max_{y'} (\langle y', Kx \rangle - F^*(y') + G(x)) - \min_{x'} (\langle y, Kx' \rangle - F^*(y) + G(x')),$$

we have

$$\mathcal{G}(\bar{x}_n, \bar{y}_n) \leq \frac{C}{k}$$

where  $\bar{x}_n = \frac{1}{n} \sum_{k=1}^n x_k$  and  $\bar{y}_n \stackrel{\text{def.}}{=} \frac{1}{n} \sum_{k=1}^n y_k$ .

**Example:** Let  $D$  be the finite differences operator and  $A \in \mathbb{R}^{m \times n}$ .

$$\min_{x \in \mathbb{R}^n} \|Dx\|_1 + \frac{1}{2} \|Ax - b\|_2^2$$

**Example:** Let  $D$  be the finite differences operator and  $A \in \mathbb{R}^{m \times n}$ .

$$\min_{x \in \mathbb{R}^n} \|Dx\|_1 + \frac{1}{2} \|Ax - b\|_2^2$$

We let  $F(z) \stackrel{\text{def.}}{=} \|z\|_1$ ,  $G(x) \stackrel{\text{def.}}{=} \frac{1}{2} \|Ax - b\|_2^2$  and  $K \stackrel{\text{def.}}{=} D$ .

**Example:** Let  $D$  be the finite differences operator and  $A \in \mathbb{R}^{m \times n}$ .

$$\min_{x \in \mathbb{R}^n} \|Dx\|_1 + \frac{1}{2} \|Ax - b\|_2^2$$

We let  $F(z) \stackrel{\text{def.}}{=} \|z\|_1$ ,  $G(x) \stackrel{\text{def.}}{=} \frac{1}{2} \|Ax - b\|_2^2$  and  $K \stackrel{\text{def.}}{=} D$ .

- We have seen that  $\text{prox}_{\gamma F} = \mathcal{T}_{\gamma F}$ .

**Example:** Let  $D$  be the finite differences operator and  $A \in \mathbb{R}^{m \times n}$ .

$$\min_{x \in \mathbb{R}^n} \|Dx\|_1 + \frac{1}{2} \|Ax - b\|_2^2$$

We let  $F(z) \stackrel{\text{def.}}{=} \|z\|_1$ ,  $G(x) \stackrel{\text{def.}}{=} \frac{1}{2} \|Ax - b\|_2^2$  and  $K \stackrel{\text{def.}}{=} D$ .

- We have seen that  $\text{prox}_{\gamma F} = \mathcal{T}_{\gamma F}$ . We can compute  $\text{prox}_{\sigma F^*}$  easily using Moreau's identity as

$$\text{prox}_{\sigma F^*}(x) = x - \sigma \text{prox}_{\sigma^{-1} F}(x/\sigma) = \begin{cases} x_i & |x_i| \leq 1 \\ 1 & x_i > 1 \\ -1 & x_i < -1 \end{cases}$$

**Example:** Let  $D$  be the finite differences operator and  $A \in \mathbb{R}^{m \times n}$ .

$$\min_{x \in \mathbb{R}^n} \|Dx\|_1 + \frac{1}{2} \|Ax - b\|_2^2$$

We let  $F(z) \stackrel{\text{def.}}{=} \|z\|_1$ ,  $G(x) \stackrel{\text{def.}}{=} \frac{1}{2} \|Ax - b\|_2^2$  and  $K \stackrel{\text{def.}}{=} D$ .

- We have seen that  $\text{prox}_{\gamma F} = \mathcal{T}_{\gamma F}$ . We can compute  $\text{prox}_{\sigma F^*}$  easily using Moreau's identity as

$$\text{prox}_{\sigma F^*}(x) = x - \sigma \text{prox}_{\sigma^{-1}F}(x/\sigma) = \begin{cases} x_i & |x_i| \leq 1 \\ 1 & x_i > 1 \\ -1 & x_i < -1 \end{cases}$$

- For  $\text{prox}_{\tau G}$ , note that  $z = \text{prox}_{\tau G}(x)$  satisfies

$$z \in \operatorname{argmin}_z \frac{1}{2} \|z - x\|^2 + \frac{\tau}{2} \|Az - b\|^2 \iff z = (\text{Id} + \tau A^* A)^{-1}(\gamma A^* b + x)$$

There are two key ingredients to dealing with nonsmooth optimisation of the form

$$\min_x F(x) + \sum_i R_i(K_i x)$$

where  $F$  is smooth,  $R_i$  are non-smooth and  $K_i$  are linear operators.

1. Gradient descent
2. Proximal mapping

Key splitting methods:

- $F + R$  Forward-Backward splitting.
- $R_1 + R_2$  Douglas-Rachford splitting
- $R_1 + R_2(K \cdot)$  Primal-dual splitting, ADMM.
